

# Ana Case Study

## Network Performance

One of our Authorized Partners was approached by a Hotel and Casino that had been fielding too many complaints from guests and employees about the hotel's network.

The hotel had recently decided to invest in a fixed-wireless solution to offer connectivity to their guests. The service was unreliable and guests often complained about poor performance.

The hotel's back office ran off a cable connection, and had a back-up connection that they frequently swapped in when the cable connection went down.

Our partner aggregated the Fixed Wireless, the two Cable connections and added an ADSL connection for extra bandwidth. Now, the back-office and guests each have their own VLANs.

### The Results:

Network Speeds: 30Mbps x 3Mbps

The casino's wireless payment system runs over the network.

Drastic reduction in complaints (only now stemming from guests who access Netflix).
