

# Ana Case Study

## Network Reliability

In the asset management industry, accessing information in real-time is critical.

One of our customers is located in a building in mid-town Toronto that is overwhelmingly serviced by the local Cable carrier. Our customers understood the importance of diversity.

When the cable carrier goes down (almost once/month) the Ana system fails-over to their ADSL provider, and the rest of the building comes to their location asking to log in to their WiFi network. Our customer stays up & remains productive.

A simple two-carrier solution creates enough redundancy that the only time they know their Cable carrier goes down, is when people from other offices start knocking on their door.

### The Results:

Flawless uptime from Cable & DSL connections.
