

In Your Business, The Lines Simply Can't Fail.

Combine Multi-Carrier Connections to Meet your
Reliability Objectives

We understand that running a restaurant relies as heavily on operational infrastructure as it does on the recipes. You need a good chef just as you need communications lines that are reliable and perform at the top of their game.

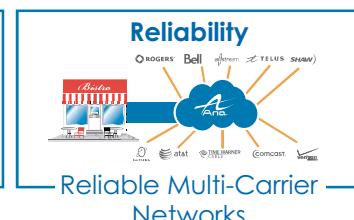

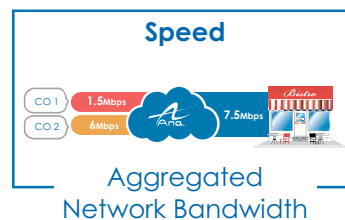

We have a system that allows restaurants to manage multiple communication lines in a unique way that delivers unparalleled up-time and speed. The Ana™ system increases your reliability by aggregating your network connections, so that you can focus on entertaining, and not have to worry about your Internet or POS system going down.

It's all about the ingredients.

The sum is truly greater than the individual parts. We take your existing lines and combine them to deliver higher speeds and better reliability than they could give you individually.

The system works by aggregating your existing communication lines into one ultra-fast, ultra-reliable network that can keep your business operating smoothly in the event of a system failure. We can then offer redundancy on all of your communications without the need to add new lines.

It's not the cut, it's what you create with it. Sometimes, however, adding new lines is inevitable. With our system, we can help you reduce your upgrade costs. The Ana™ system will deliver the greatest possible speeds from lines that traditionally deliver lower bandwidth. We can combine phone lines so that they deliver speeds of a DSL, and DSL lines that deliver the speeds of E10s. Scaling up your business has never been easier, or more cost-effective.
